ABSTRACT

This project presents a resume analysis platform designed to automate resume screening. The application extracts key details such as skills, education, and experience from resumes and compares them with job descriptions to generate a skill match score. It uses document parsing and keyword-based matching techniques for analysis. AI APIs are integrated to generate resume summaries and provide skill insights. The platform helps improve recruitment efficiency and reduces manual screening effort.

1.1 Problem Background

In today's digital recruitment environment, organizations receive a large number of job applications for a single position. Recruiters spend significant time manually reviewing resumes, which leads to slower hiring decisions and possible oversight of qualified candidates. Traditional resume screening methods are inefficient, error-prone, and lack consistency. Important candidate skills, certifications, and experience may be missed due to human fatigue or time constraints. With the rapid growth of job seekers and digital hiring platforms, there is a strong need for an intelligent automated system that can quickly analyse resumes, extract meaningful information, and help recruiters make faster and more accurate hiring decisions.

1.2 Objective of the Project

The objective of this project is to develop an AI-powered resume analyzer that automatically extracts key candidate information from resumes and compares it with job descriptions to generate a skill match score, helping recruiters shortlist candidates efficiently and accurately.

1.3 Proposed Solution / System Overview

The proposed solution is a resume analysis platform that accepts resumes in PDF or DOC format and processes them using text extraction and intelligent text analysis techniques. The application identifies candidate details such as name, education, skills, certifications, and work experience. It then compares extracted skills with a given job description and calculates a match score. The major modules of the platform include resume parsing, skill extraction, job description analysis, match scoring, and user dashboard. These modules work together to provide structured resume insights and automated candidate evaluation.

1.4 Key Features or Functionality

The application provides automatic resume text extraction, skill identification, and experience classification. It generates a skill match score based on job requirements. The platform supports multiple resume formats and provides a user-friendly dashboard for recruiters. It reduces manual screening time and improves hiring accuracy. The system also allows job description input and comparative candidate analysis. AI-based

recommendations help highlight strong candidate profiles, making the recruitment process faster and more reliable.

1.5 Technology / Method Used

The system is developed using React/Next.js for frontend and Node.js/Next.js for backend API handling. Resume text is extracted using document parsing libraries. Skill matching is performed using keyword-based comparison. AI APIs are used for resume summarization, skill insights, and intelligent analyses of resume content.

1.6 Expected Outcome & Benefits

The platform is expected to reduce manual resume screening time and improve recruitment efficiency. It helps recruiters quickly identify qualified candidates based on skill relevance. It ensures consistent evaluation and reduces human bias. The application improves hiring quality, speeds up decision-making, and enhances candidate shortlisting accuracy. It can be used by HR teams, recruitment agencies, and organizations managing large-scale hiring.

1.7 Original Contribution Statement

This project introduces an AI-supported resume analysis platform with automated skill matching and scoring, improving recruitment efficiency and reducing manual effort in candidate screening.
